

Information Quality Environment, Culture, and Governance

John R. Talburt, PhD, IQCP

DATA GOVERNANCE

Governance

- Governance is a framework for defining roles and responsibilities and the rules for making decisions within an organization
 - Example: Forming a club or association
 - What is its purpose? What are the officers? The committees?
 - What are the qualifications? How are they selected? What are their responsibilities? What authority do they have?

Data Governance

- Framework for defining roles and responsibilities and the rules for making decisions about data management in an organization
 - Data Management is the decision you make
 - Data Governance is the structure for making the decision

RACI Model

- R = Who is responsible for change – Actually makes the changes
- A = Who is accountable – Makes sure the changes are made (owner, trustee)
- C = Who should be consulted about the changes
- I = Who only needs to be informed about the changes

Communication & Control

- Data Governance is fundamentally about Communication & Control
 - A single-point of communication about all data in the organization
 - Data dictionary, business rules, DQ rules, compliance rules, etc...
 - A single-point of control over all data in the organization
 - Changes to data must be approved
 - Changes to data processes must be approved

Motivations for Data Governance

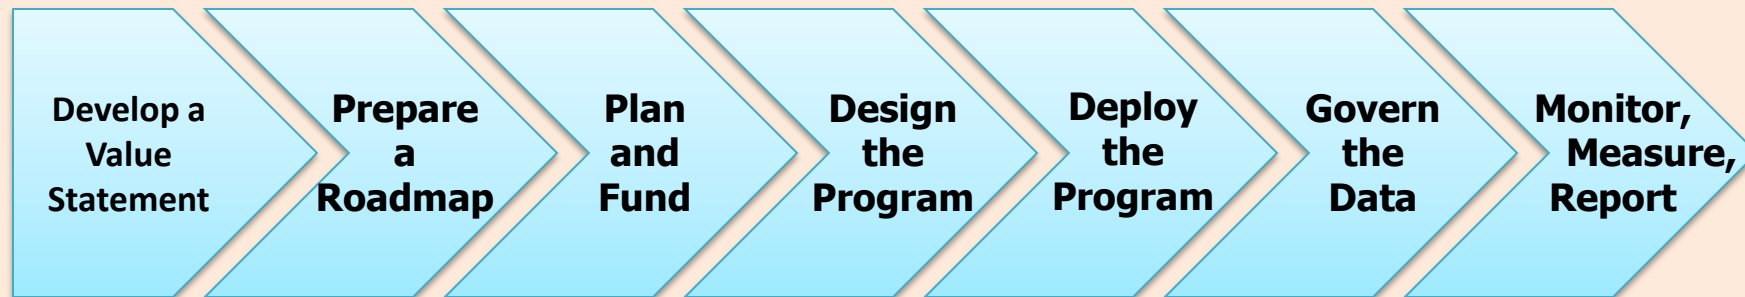

- Risk and Compliance
 - Data access, controls, proving compliance, change control
- Organizational Transformation
 - New capabilities, understanding change, enabling and supporting change, alignment
- Organizational Integration
 - Data sharing, data analysis

Data Stewardship

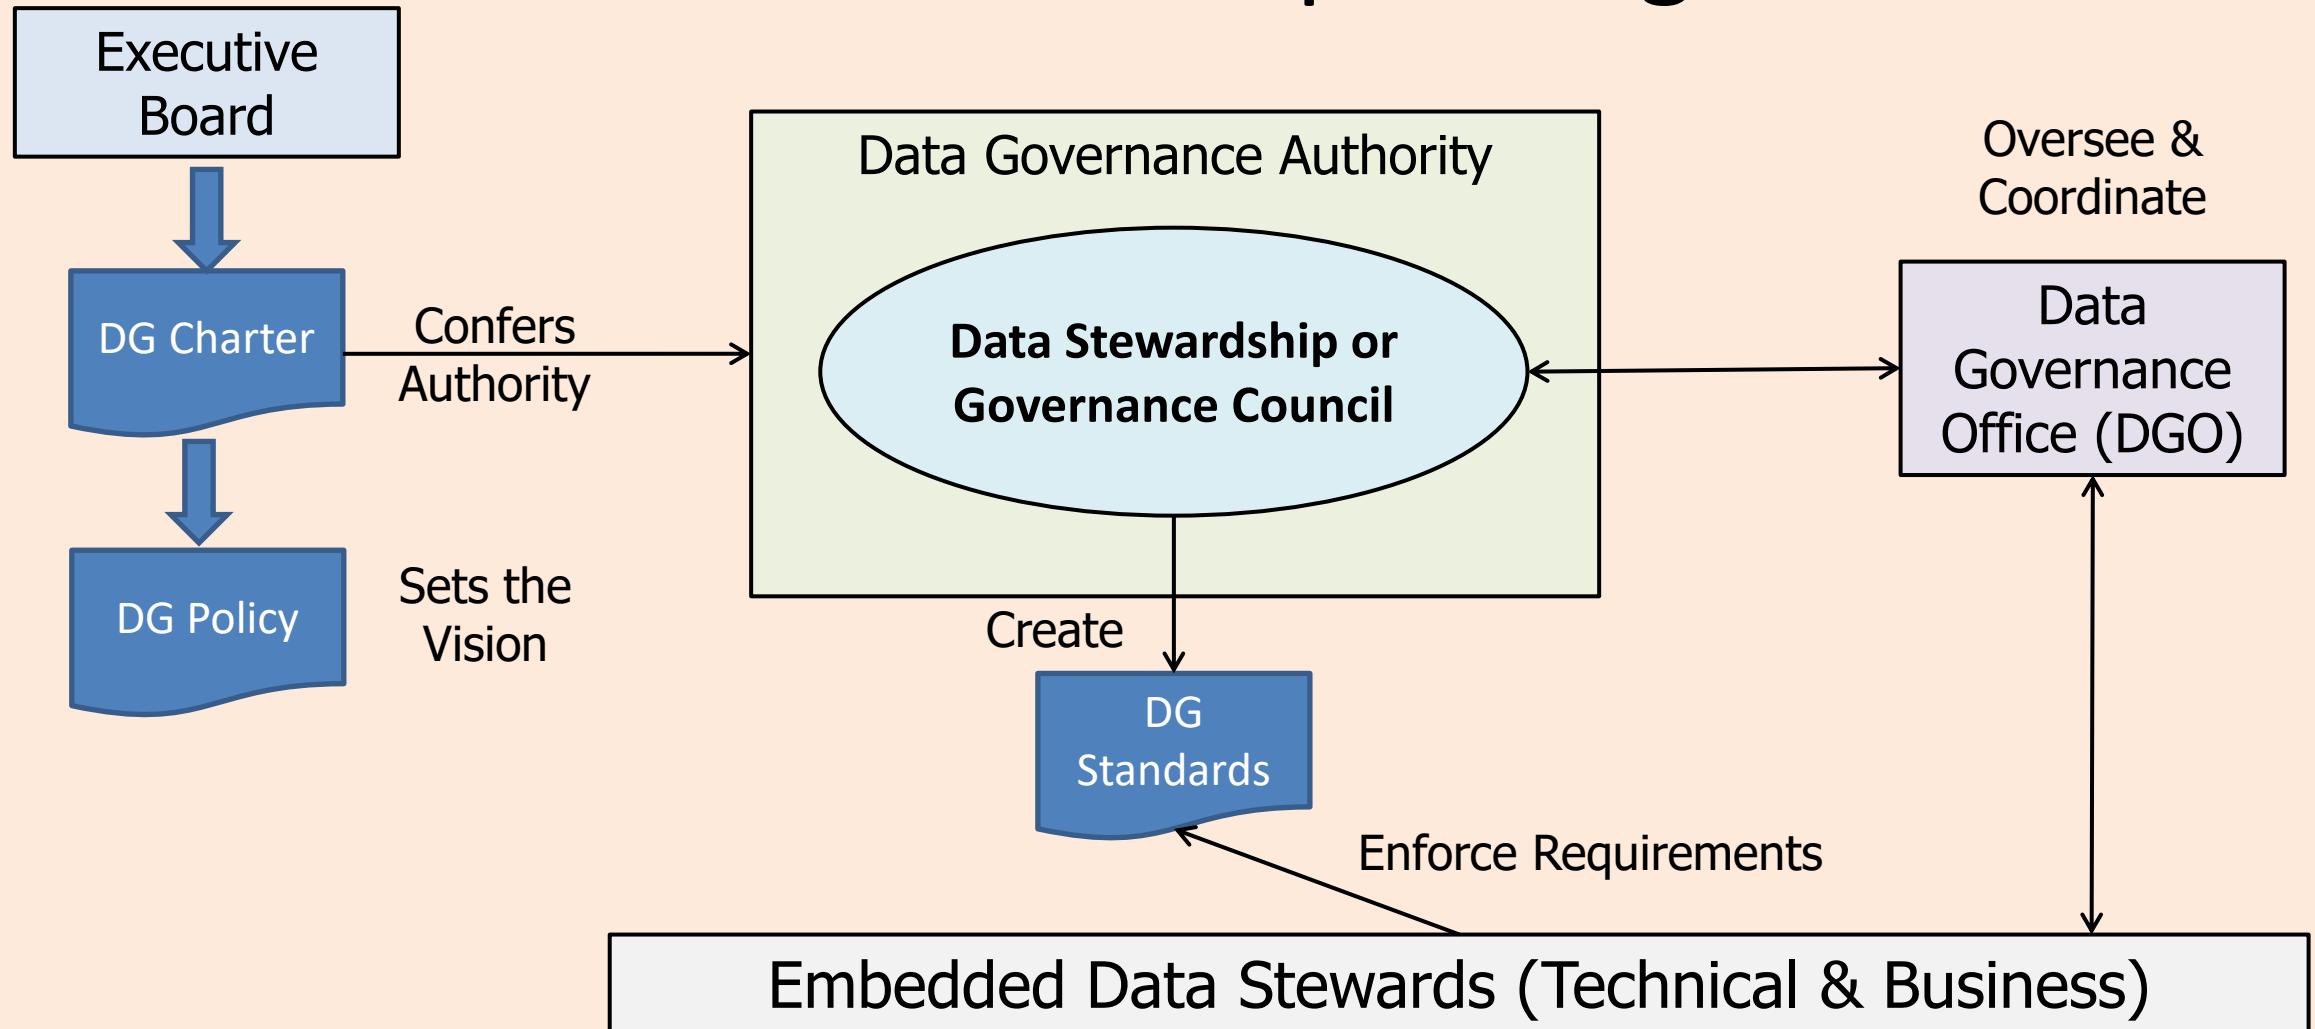

- Recognition that the information is an organizational asset
- No one person, department, or group “owns” the data – they are only stewards (caretakers) of the data on behalf of the organization
- Therefore, data management decisions must take into account the potential impact on all parts of the organization

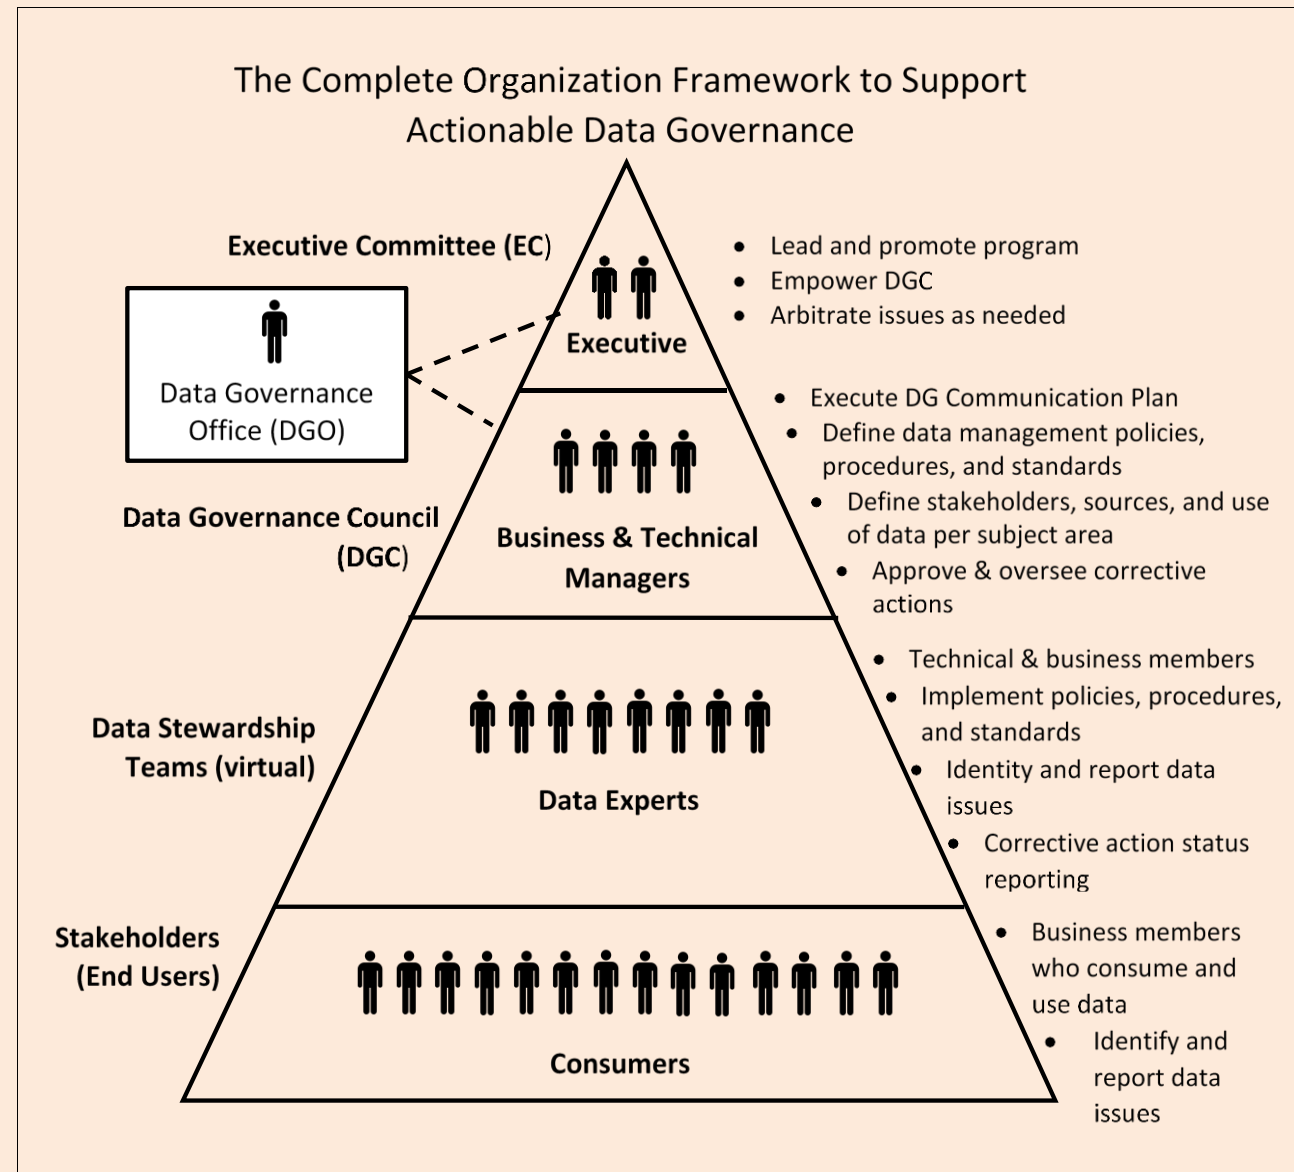

Setting Up a Program

- Define Your Mission
- Decide on Initial Focus
 - Policy-Standards-Strategy, Data Quality, Privacy/Compliance/Security, Architecture/Integration, Data Warehouse and BI, Management Alignment

Data Governance Operating Model

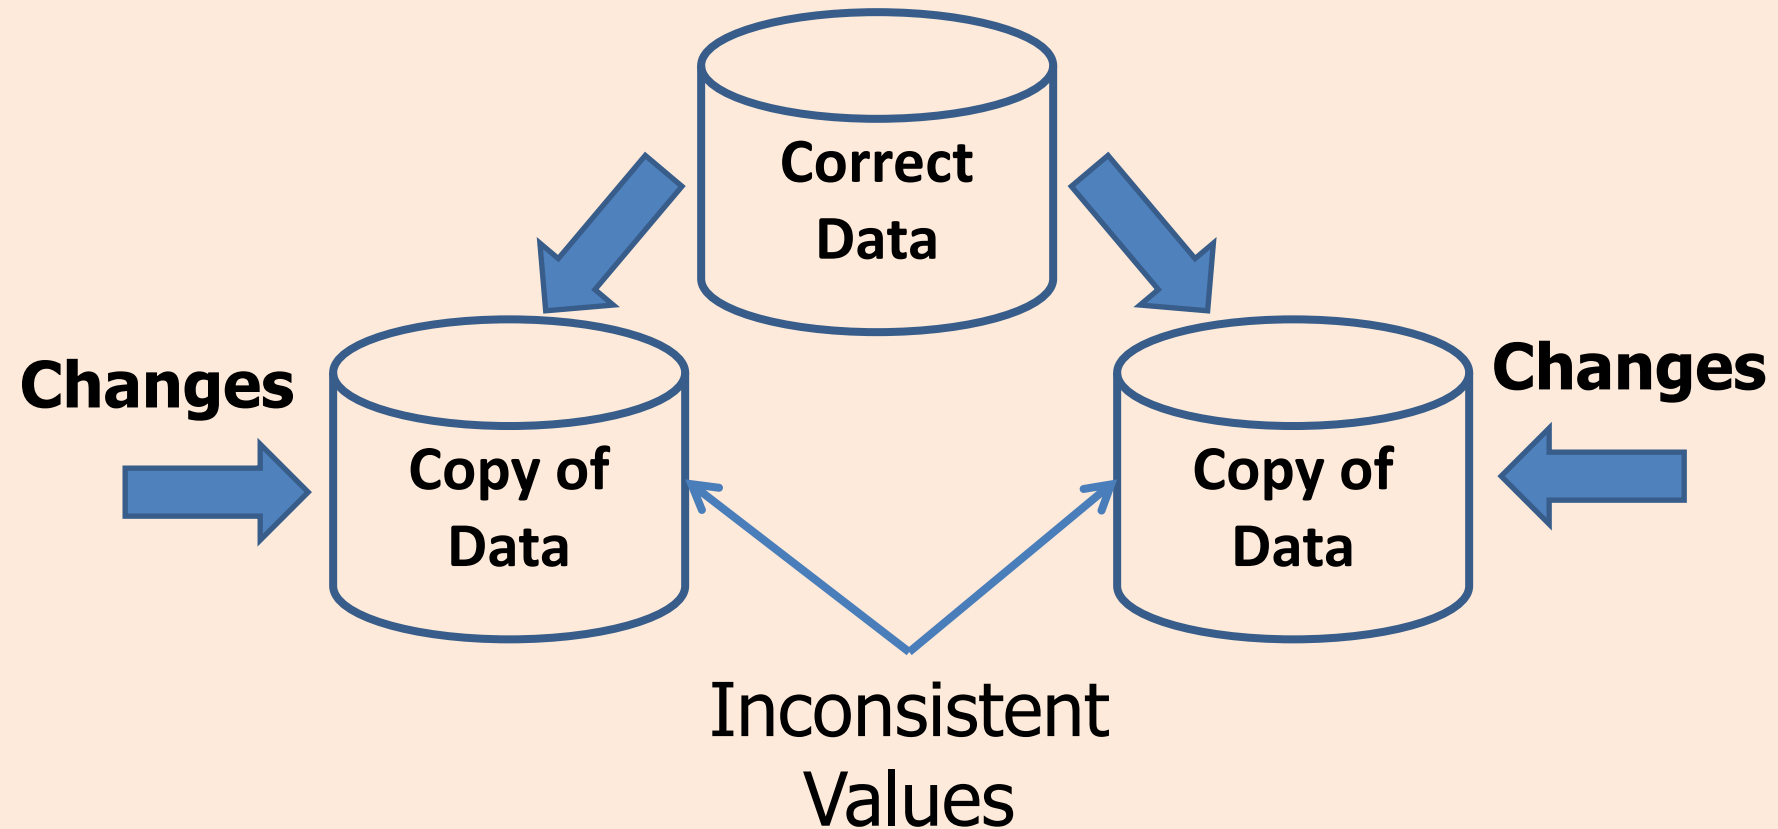

Typical DG Program Components

- Data dictionary and business glossary (metadata management)
- Enterprise repository for DG policies and procedures, business rules, regulatory compliance guidelines, data standards, etc.
- Data Quality Management Program
- Master Data Management Systems for key entities
 - Customers, Products, Locations, Events, ...
- Reference Data Management Systems for codes
 - Postal codes, product codes, building codes, ...
- Ongoing Training and Communications

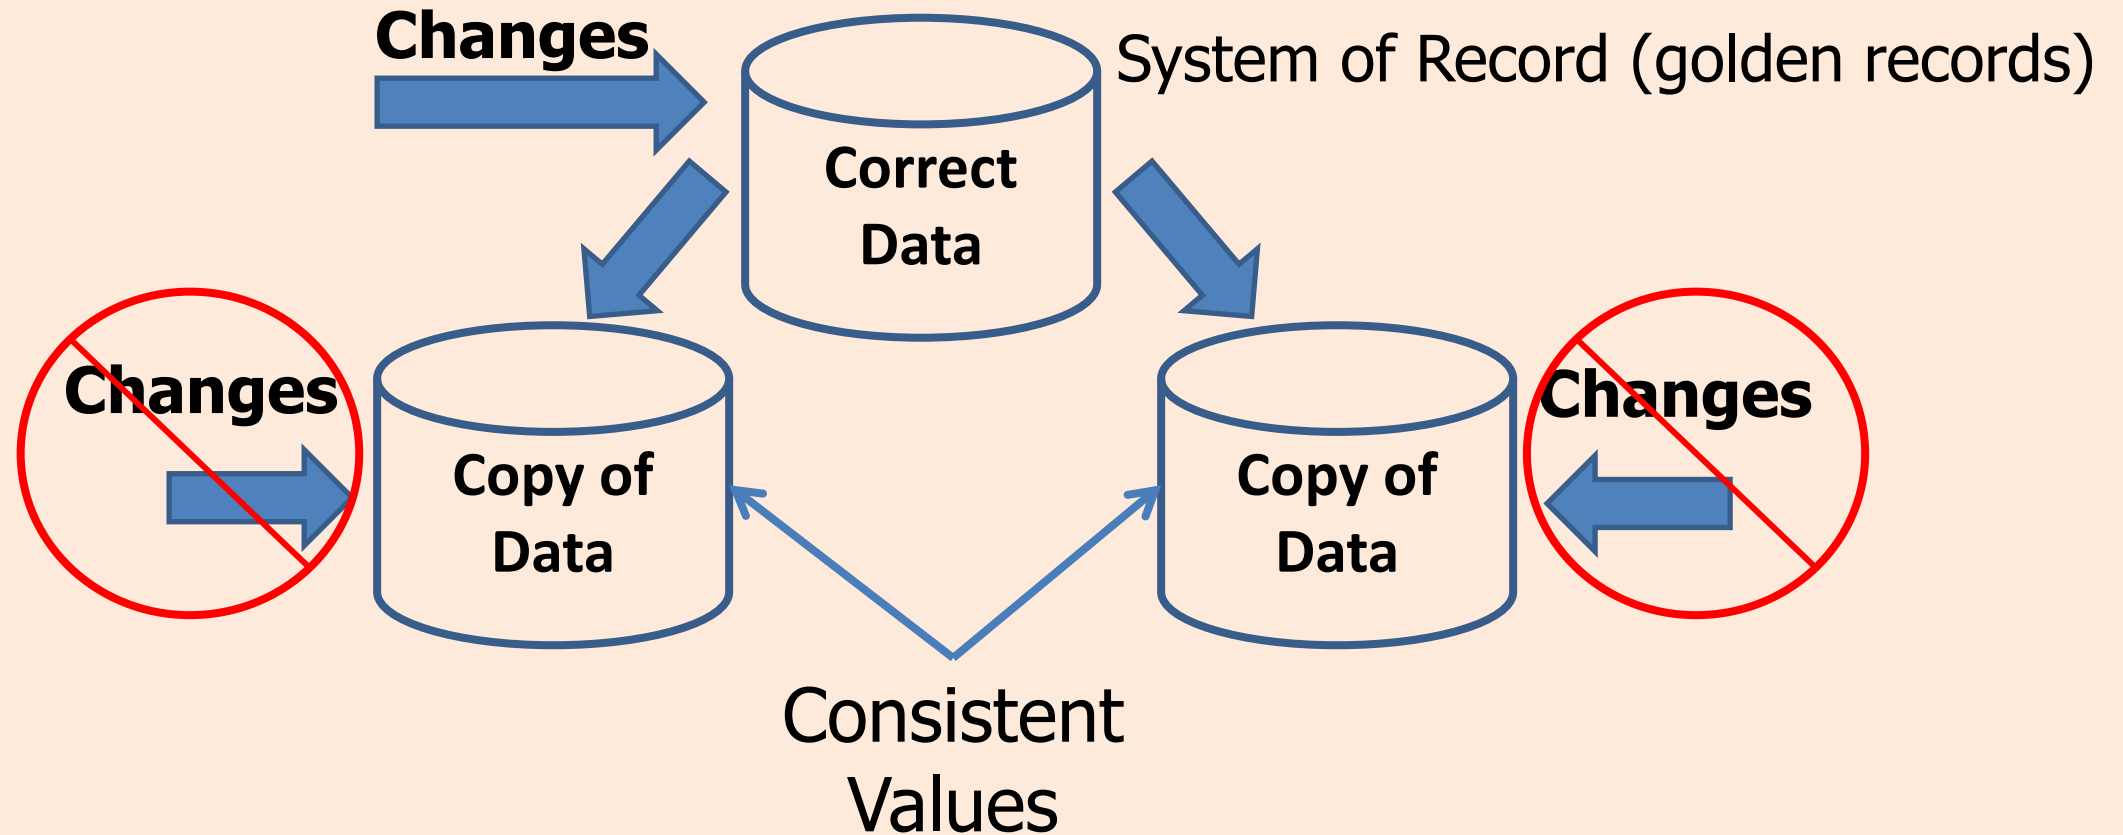

Inconsistency and Redundancy

- The greatest enemy of data quality is inconsistency
- The primary cause of inconsistency is redundancy – copies of data in different locations
- Without deliberate effort and control redundant data will lose synchronization – become inconsistent

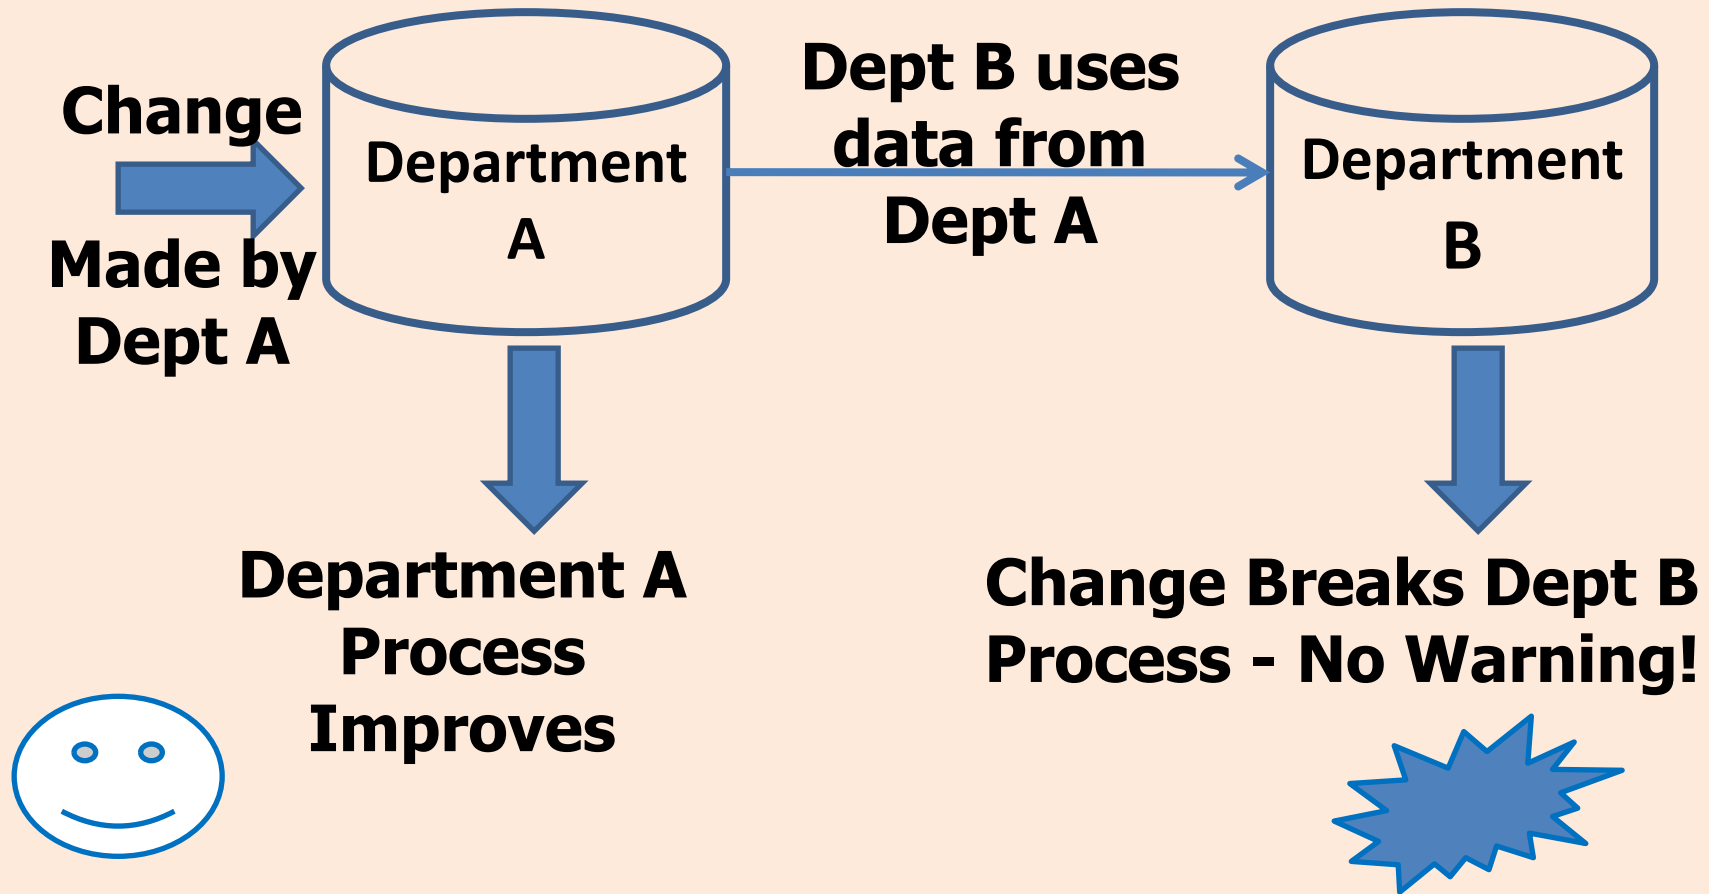

Loss of Synchronization

Master Data Management

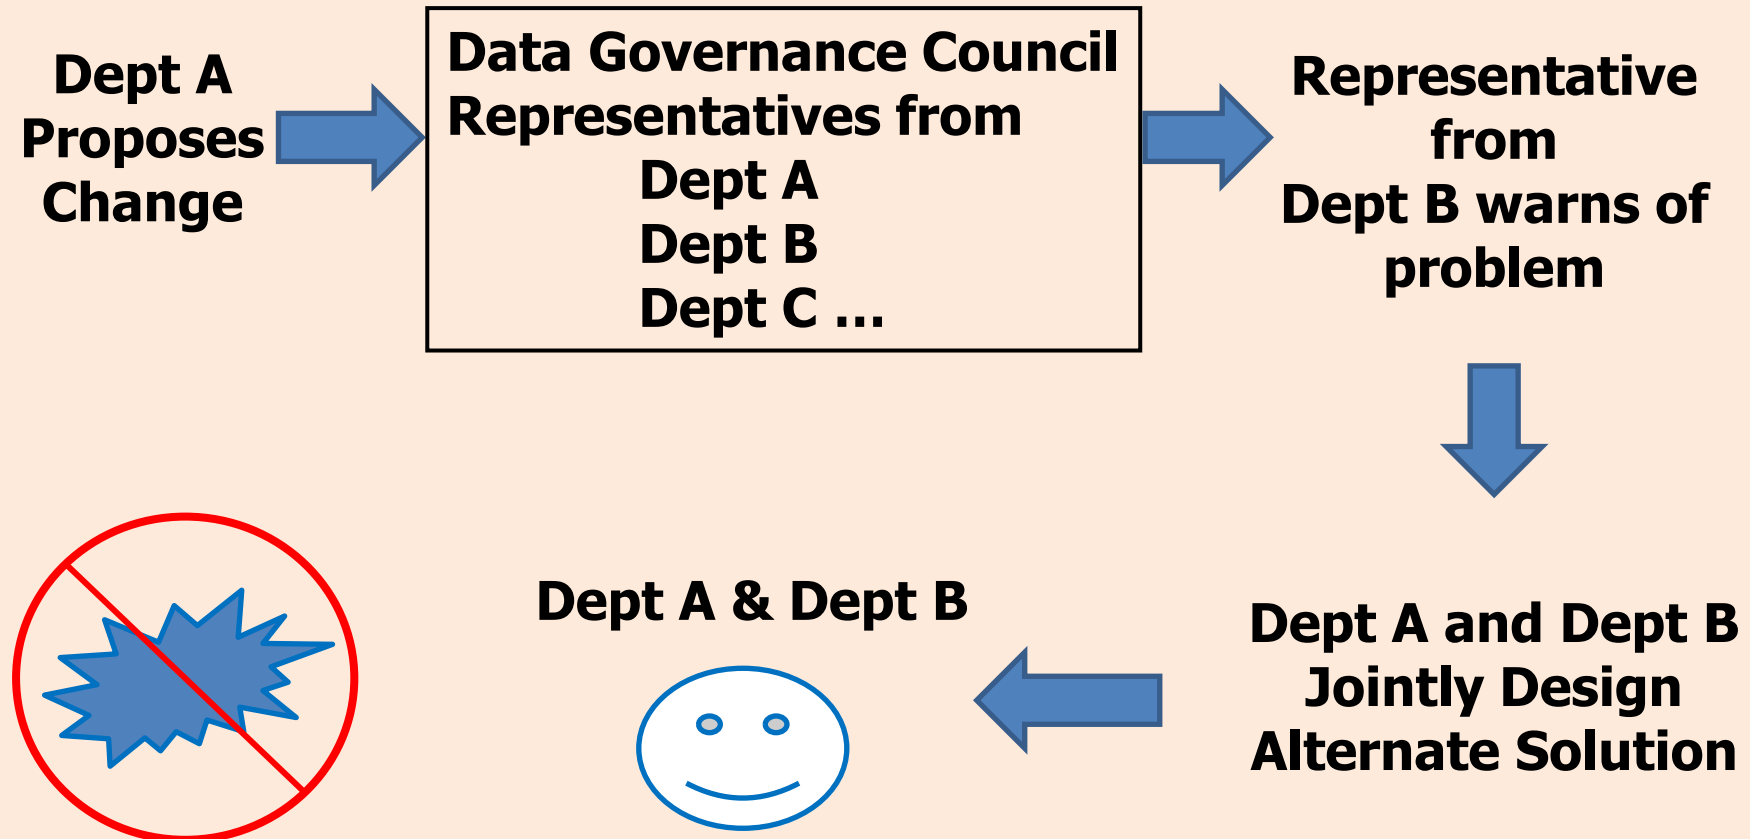

Unilateral Change

Notification and Agreement

- An essential part of data governance is to avoid the unilateral change scenario
- Governance Council with representatives from all parts of the organization
- Any changes must first come to the Council
- Council agrees with or denies change or suggests alternative
- Resolves conflicts on data management

Managed Change

Promotes Communication

- Data Governance Council can not only prevent adverse events from unilateral change
- Can also promote communication to
 - Eliminate unnecessary redundancy (Build Trust)
 - Uncover data quality problems at the enterprise level
 - Suggest improvements in the information architecture that benefit the entire organization

Data Governance Metrics

- Progress Metrics
 - How many standards developed and approved
 - How many data items defined and entered into the catalog
- Verification Metrics
 - Review to assure system changes conform to standards
- Validation Metrics (Is DG achieving value proposition?)
 - Are regulatory violations/fines trending down? Is DQ improving?
 - Can be challenging to develop and measure

Introducing Data Governance

- Emphasize the positive aspects, not the procedures and control
- Explain the VALUE to enlist sponsors
- When talking to key stakeholders ask
“Do you want to be consulted about changes before they are made, or do you just want to be informed after they are made?”

Five Most Common Mistakes

- Lack of Authority – No written policies, standards, guidelines, rules, or DG agreements
- Inadequate Infrastructure – Lack of funding, allocation of time for DG work, no admin staff
- Politics and Power Struggles – DG should be neutral territory
- Lack of Participation – Need a critical mass to succeed
- Perceived as Delivering Low Value – Same issue as information quality, must communicate VALUE of DG

Questions and Discussion
